CHAPTER 1

INTRODUCTION

Educational institutions are continuously modernizing their administrative processes to enhance efficiency, accuracy, and service delivery. A critical area for improvement is the student enrollment system, which in many schools, including Baesa Adventist Academy (BAA), remains predominantly manual. Traditional enrollment methods, characterized by paper-based forms, manual data encoding, and in-person transactions, often lead to long queues, repetitive procedures, data entry errors, and limited accessibility of student records (Mayo et al., 2022). These inefficiencies are compounded during peak enrollment periods, creating bottlenecks that strain administrative resources and diminish the experience for both parents and staff. The challenges of manual enrollment are not unique to BAA. As highlighted in local studies, the transition to web-based enrollment systems has proven to significantly minimize user errors, shorten processing time, and improve overall administrative efficiency (Aspa et al., 2025). Such systems replace fragmented records with a centralized digital platform, ensuring consistent and reliable data flow. Furthermore, the integration of automated features, such as assessment slip generation, addresses the critical need for accurate and instantaneous computation of school fees, discounts, and payment balances—a process that is notoriously prone to error when done manually (Javelosa et al., 2018). Inspired by these demonstrated benefits, this study proposes the design and implementation of a Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy. This capstone project aims to develop a centralized online portal that will digitize the entire enrollment workflow, from student registration to the automated calculation and generation of assessment slips. By doing so, the system seeks to directly address the inefficiencies of BAA's current manual processes, providing a reliable, efficient, and user-friendly solution that aligns with the school's operational needs and goals for digital transformation.

Project Context

Baesa Adventist Academy (BAA), an institution established in 1967, continues to serve a growing student population of approximately 528, supported by a staff of 19. Behind its long-standing service to the community, however, lies an enrollment and record-keeping process that remains largely manual. The process begins when the parents or guardian personally go to the school registrar's office to complete the enrollment process. From there, they manually accomplish required information, fill out paper forms, and submit the necessary documents. In some cases, the process stretches over as the completion of these requirements does not happen all at once; parents may return over the course of several weeks if certain documents are not immediately available. Once the forms and requirements are submitted, the registrar then manually reviews and encodes the student's information into a local computer system, which is primarily composed of spreadsheets. Because the records are not centralized, retrieving information, checking documents, and printing records for review often take time and additional effort. Another significant major concern stemming from this manual setup, the school also faces growing difficulties in handling financial concerns. Tuition fees, miscellaneous fees, and applicable discounts are all computed manually, which increases the risk of miscalculation and causes delays in preparing the student's statement of account. The assessment slip, which should clearly show the student's financial obligations, is therefore generated slowly and often with difficulty. This becomes especially challenging during the weeks leading up to the opening of classes, when a larger number of parents come in to enroll their children and the office experiences a noticeable increase in workload and waiting time. The situation becomes even more demanding in the area of accounting and payment validation. In the current setup, students are required to settle their monthly dues before they are allowed to take examinations. However, the principal has become heavily burdened because she is the one personally validating promissory notes. This added responsibility contributes to her stress, especially when parents begin raising concerns about accounting-related issues. In many instances, the official receipt becomes the only proof that a student has already paid, yet it does not provide a full breakdown of the remaining balance, the amount already deducted, or the overall computation of fees. As a result, many parents return to the school requesting a student

assessment form or a clearer summary of their payments, but the school is often unable to provide one. This lack of transparency has led to frustration among parents, and in some cases, the principal herself becomes the target of complaints, particularly during examination periods when payment verification is strictly required before students may take their exams. These challenges are consistent with the gaps identified in related literature. Studies by Aspa et al. (2025) and Mayo et al. (2022) found that manual enrollment processes inherently cause inefficiencies such as long queues and data errors, which can be effectively resolved by a structured, web-based system. Furthermore, the work of Javelosa et al. (2018) and Franceliso et al. (2015) demonstrates the value of integrating enrollment with a centralized Student Information System (SIS), particularly through automated assessment features that ensure financial computations are based on accurate, centralized data.

General Problem

How to develop Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy?

Baesa Adventist Academy continues to rely on a fully manual, paper-driven enrollment process that has remained unchanged for years. Despite handling more than 500 students annually, the school has no centralized digital system to manage registration, student information, or financial assessments. As revealed in interviews with administrators, registrars, and parents, nearly every step of the enrollment process—from filling out forms to computing tuition fees—is performed by hand, leading to delays, inconsistencies, and recurring frustrations for both staff and families.

At the start of every school year, parents line up at the registrar's office, sometimes waiting nearly an hour just to secure or submit forms, especially when multiple families arrive at once. A parent shared that during peak enrollment, lines can stretch to about ten people, forcing them to either wait in crowded hallways or leave and return later. New students face additional delays because their documents—such as birth certificates, 137, and certificates of good moral—must be checked manually, encoded manually, and filed manually. The absence of a digital portal means that every missing document requires

families to return to the school multiple times, as some parents interviewed reported needing to visit two or three separate times to complete their child's enrollment.

Administrative staff also face significant operational burdens. All student data is encoded manually into spreadsheets stored on a local computer; these files serve as the school's only database. According to the registrar, handwritten forms often contain incomplete or illegible information, requiring additional back-and-forth verification. Lost or misplaced documents are a recurring problem, as some records get mixed with other forms or fail to be encoded during busy periods. Because student data is not centralized, retrieving information requires manually searching spreadsheets and printing files, slowing down operations whenever parents or teachers request information.

Financial assessment, one of the most critical components of the enrollment process, is also carried out entirely by hand. Tuition fees, payment modes, miscellaneous fees, and discounts must be computed manually by the registrar, using generic paper templates. These computations are prone to inconsistencies, leading to instances where parents receive different assessed amounts at different times. In the interviews, the administration described how hectic workloads sometimes cause overlooked entries or calculation discrepancies, resulting in disputes and confusion. Parents receive no real-time updates and rely solely on physical letters or in-person visits to learn about outstanding balances. Without a central financial system, there is no automatic audit trail, no way for families to view their payment history, and no digital reference to ensure that assessment slips are accurate and consistently applied.

As the number of documents increases during enrollment season, so does the burden on staff. Filing cabinets fill with physical forms and photocopied records, and staff must often switch between paper stacks and spreadsheets to process each student. These repetitive manual steps not only slow down workflow but also make the entire enrollment pipeline vulnerable to human error, delays, and data inconsistencies—problems that become most visible during busy weeks leading up to the opening of classes.

Specific Problem

- *How to develop an online enrollment module for new, old, and transferee students?*

The enrollment process at Baesa Adventist Academy operates through an entirely manual, paper-based system that creates multiple points of failure and inefficiency throughout the student registration pipeline. For incoming freshmen, returning students, and transferee students, the procedure mandates physical presence and manual paperwork completion, requiring families to make special trips to the school campus during limited office hours. The current method involves parents and guardians filling out enrollment forms by hand, which often leads to illegible handwriting, incomplete fields, and inconsistent data formatting that further complicates the registration process. During peak enrollment periods, particularly in the weeks leading up to the academic year, the registrar's office becomes overwhelmed with paper forms, creating massive backlogs that can take days or even weeks to process. The manual data encoding phase introduces critical vulnerabilities where spreadsheet operators must interpret handwritten information and transfer it digitally, a process that frequently results in data corruption, transposition errors, and missing information that may not be discovered until much later in the academic year.

- *How to develop a document upload feature for submitting enrollment requirements?*

The submission of enrollment requirements at Baesa Adventist Academy is handled entirely through physical documents, creating several points of delay and confusion for both families and registrars. Parents must bring printed copies of numerous records such as birth certificates, Form 137, and good moral certificates, all of which must be personally reviewed by the registrar. During interviews, staff noted that many parents struggle with keeping track of the complete list of required documents, leading to frequent instances of missing or incomplete submissions. These gaps are often discovered only when the registrar manually checks the paperwork at the counter, forcing families to return on another day to supply the missing items. The reliance on physical documents also brings risks that accumulate over time. Important papers can be misplaced, accidentally mixed with other files, or damaged while being transported by parents or

handled within the registrar's office. Since each requirement must be encoded into spreadsheets by hand, this creates additional bottlenecks during peak enrollment weeks, where clerical workload increases and errors are more likely to occur. The manual nature of these processes leaves registrars with the burden of repeatedly verifying documents, matching them to the correct student, and ensuring that none have been overlooked—tasks made more difficult when the volume of enrollees grows and paperwork begins to pile up. These issues make requirement handling one of the slowest parts of the enrollment process. Incomplete submissions, repeated follow-ups, misfiled documents, and time-consuming manual verification all contribute to delays that affect both parents and school staff.

- *How to develop an automated tuition and fee assessment module?*

The financial assessment process at Baesa Adventist Academy suffers from profound inefficiencies due to its complete reliance on manual calculations and individualized attention for each student's tuition structure. Registrars and accounting personnel must navigate complex, multi-layered fee schedules that vary by grade level, program type, and student status, requiring constant reference to printed rate sheets and manual bulletins that may become outdated or contain conflicting information. Each assessment requires the staff member to perform a series of manual calculations including base tuition, laboratory fees, miscellaneous fees, book costs, and other ancillary charges, then apply applicable discounts for early payment, sibling enrollment, or special programs, followed by payment plan calculations that determine installment amounts and due dates. This labor-intensive process must be repeated every single time a parent requests an assessment slip, whether for initial enrollment, payment planning, or replacement of lost documents, consuming enormous amounts of administrative time that could be allocated to more value-added activities. The manual nature of these calculations creates significant financial control risks, including calculation errors, inconsistent application of discount policies, transcription mistakes, and potential compliance issues with the school's established financial guidelines. Furthermore, the absence of automation means there is no audit trail for assessment changes, no version control for revised assessment slips, and no systematic way to ensure consistency across different staff members performing the calculations. This inconsistency has led to numerous parent complaints where the amount

communicated verbally by registrar staff differs from the amounts printed on assessment slips, creating confusion and eroding trust in the school's financial management. Parents frequently report being informed of different payment amounts when settling their monthly dues, sometimes discovering additional unexpected charges or being surprised by unapplied discounts, leading to disputes and dissatisfaction with the billing process.

- *How to implement a student-accessible financial portal for viewing payables?*

The complete absence of a self-service financial information system creates a fundamental breakdown in financial communication and transparency between the school administration and parent community. Parents currently have no means of independently accessing their financial information, forcing them to rely exclusively on direct personal interaction with school staff for every financial inquiry, no matter how simple or routine. This dependency creates constant interruptions for administrative personnel who must repeatedly access the same financial records to answer balance inquiries, payment history questions, and assessment slip requests that could easily be addressed through an automated system. The manual nature of information provision means that parents receive financial updates intermittently and inconsistently, often learning about payment deadlines only when they receive physical letters or when their children are prevented from taking examinations due to outstanding balances. The lack of real-time financial visibility means parents cannot proactively monitor their payment status, track their payment history, plan for upcoming financial obligations, or verify that payments have been properly credited to their accounts. This information gap is exacerbated by the inconsistent assessment calculations, where parents cannot independently verify why payment amounts might differ between what they were told previously and what appears on current statements. The administrative burden of continuously responding to financial inquiries and resolving disputes over inconsistent payment amounts diverts staff attention from more strategic financial management tasks and creates persistent friction in the school-parent relationship, ultimately affecting the institution's operational efficiency and family satisfaction.

Objectives

The objectives of this project are to guide the development and implementation of Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy.

General Objectives

To develop Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy.

This system aims to digitize and streamline the entire student enrollment process, replacing the current manual, paper-based methods. By introducing an online enrollment portal and automated financial assessment, the system will improve data accuracy, enhance operational efficiency, reduce processing time, and provide transparent financial information to parents and administrators.

Specific Objectives

- *To develop an online enrollment module for new, old, and transferee students.*

This objective constitutes the core operational component of the Advent-Link system, engineered to entirely replace the current labor-intensive, paper-dependent registration process that necessitates physical presence and manual form completion. The module will be constructed as a sophisticated web-based platform utilizing HTML5 for semantic markup and structural integrity, CSS3 with Bootstrap 5 framework for responsive, mobile-first design implementation, and JavaScript (ES6+) for advanced client-side interactions including dynamic form validation, real-time error checking, and asynchronous data processing. The server-side infrastructure will be developed using PHP, implementing complex business logic that encompasses

intelligent student categorization (distinguishing between new enrollees and returning students), automated academic period detection, curriculum-based grade level validation, and prerequisite checking for course selection. The system will feature a multi-phase form workflow with persistent session management, enabling parents to initiate, save, and complete registrations across multiple sessions without data loss. For returning students, the system will automatically retrieve and pre-populate existing demographic and academic records from the centralized MySQL database, presenting them for verification and selective updates rather than requiring comprehensive re-entry. The enrollment process will integrate sophisticated data quality controls including automated duplicate record detection using fuzzy matching algorithms, real-time field validation leveraging the system's validation system, conditional form logic that displays relevant fields based on previous inputs, and comprehensive mandatory field enforcement to guarantee data integrity. Upon successful form submission, the system will trigger automated email confirmations to parents using the system's mail services with SMTP integration and generate internal alert notifications to registrar staff through dashboard announcements, establishing a completely digital workflow that eradicates paper forms, reduces processing duration from several hours to mere minutes, and delivers complete transactional visibility to both parents and administrative personnel throughout the entire enrollment lifecycle.

- *To develop a document upload feature for submitting enrollment requirements.*

This objective addresses the critical documentation management deficiencies within the current enrollment framework by implementing a secure, systematically organized, and highly efficient digital system for requirement submission, verification, and archival. The document upload functionality will be architected as an integral component of the enrollment module, employing PHP for robust server-side file processing, validation, and storage management, JavaScript for enhanced user interface interactions, and MySQL for comprehensive metadata indexing and document tracking. The system will deploy an intelligent document categorization engine that dynamically

presents parents with specific requirement checklists tailored to student type (new/returning), grade level, academic program selection, and special enrollment conditions. The front-end interface will incorporate advanced user experience features including drag-and-drop file upload capabilities using JavaScript libraries, visual progress indicators for batch upload operations, and instantaneous file validation verifying format compliance (PDF, JPG, PNG), size constraints, resolution quality, and document integrity. Each successfully uploaded document will be automatically associated with student records through database relations, tagged with comprehensive metadata including document classification, upload timestamp, file checksum, and review status (pending/approved/rejected/requires-resubmission), and securely stored in encrypted directories with proper permission controls on the server. The administrative interface, developed using server-side templating, will provide registrar staff with an organized document management dashboard featuring bulk operation capabilities, status modification tools, automated deficiency reporting for incomplete submissions, and side-by-side document comparison functionality. The system will implement enterprise-grade security measures including server-side access control mechanisms for access control, automated backup routines with version history tracking, cryptographic hashing for file integrity verification, and audit logging for all document access and modification events. This holistic digital document management approach will completely eliminate physical document transportation and storage vulnerabilities, and establish a permanent, searchable, digitally preserved archive that can be instantly retrieved by authorized personnel throughout the student's entire academic tenure at the institution.

- *To develop an automated tuition and fee assessment module.*

This objective establishes the sophisticated financial computation core of the enrollment system, specifically engineered to eradicate the error-prone, labor-intensive manual calculation methodologies that currently result in inconsistent billing statements, parental disputes, and administrative inefficiencies. The module will be constructed as an advanced rule-based assessment system utilizing PHP for complex business logic implementation and MySQL for storing comprehensive, relationally-structured fee tables, discount policy matrices, and payment plan configurations. The system will incorporate a dynamic, multi-dimensional fee calculation engine that automatically applies appropriate tuition rates, miscellaneous charges, and other applicable costs based on the student's grade level, program selection, and special academic requirements. The assessment processor will execute intricate discount hierarchy evaluations using the system's ORM-based data access layer with advanced query optimization, automatically

applying sibling discounts, early payment incentives, scholarship allocations, financial aid adjustments, and special program fee modifications according to institution-defined business rules and eligibility verification protocols. The system will generate multiple payment plan alternatives, performing precise calculations for down payment requirements, installment amounts, payment scheduling, and due date assignments while rigorously enforcing minimum payment thresholds, deadline constraints, and penalty assessment rules. For complete financial transparency, the assessment slip will generate a comprehensive line-item breakdown of all charges, adjustments, and computations using FPDF libraries for high-fidelity PDF generation, clearly presenting both the calculation methodology and final amount determinations. The module will seamlessly integrate with the PDF generation subsystem to produce professionally formatted, institution-branded assessment slips that serve as legally recognized billing documents. This fully automated computational approach will guarantee mathematical precision across thousands of simultaneous calculations, maintain absolute consistency throughout all student financial assessments, and deliver instantaneous assessment generation upon enrollment finalization.

- *To implement a student-accessible financial portal for viewing payables.*

This objective creates an advanced, transparent, self-service financial information ecosystem that empowers parents and students with immediate, comprehensive access to their financial obligations, payment history, and account status, thereby significantly reducing the administrative burden on school staff while enhancing financial accountability and trust. The financial portal will be developed as a secure, multi-tiered, role-based module within the primary web application, utilizing HTML5 and CSS3 with Bootstrap 5 framework for an intuitive, fully responsive interface and JavaScript with AJAX capabilities for dynamic data visualization, real-time updates, and interactive financial planning tools. The PHP backend will implement sophisticated user authentication mechanisms, session management protocols, and optimized data retrieval processes from the MySQL database using ORM-based data access layer with eager loading and query caching, ensuring that financial information displays with sub-second latency and absolute accuracy. The portal dashboard will present an exhaustive financial overview including real-time account balance, itemized payment history with complete transaction metadata, upcoming payment deadlines with automated priority highlighting, downloadable assessment slips with version control, and predictive financial forecasting based on payment patterns. The system will maintain an immutable audit trail of all financial transactions, payment applications, account adjustments, and portal access events using MySQL database relations with temporal tracking, providing complete financial transparency and regulatory compliance. This

sophisticated portal will fundamentally transform the parent financial experience from a state of dependency on administrative staff for basic information to one of empowered financial management through instantaneous, accurate, comprehensive self-service access, thereby dramatically reducing administrative workload, minimizing billing disputes, preventing payment delays, and establishing unwavering trust through radical financial transparency and accountability.

Scope

The project centers on the development and implementation of Advent-Link: A Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy. This system is designed to digitize and streamline the student enrollment process through a secure online portal that handles student registration, document management, financial assessment, and payment tracking. By adopting a centralized digital approach, the system seeks to eliminate manual paperwork, reduce processing errors, ensure consistent financial calculations, and provide real-time access to enrollment information for students, parents, and administrators.

The proposed system will include both front-end and back-end components that cater to different users within the school community. The following outlines the features available for each user group:

The Administrator can access the following:

- *Enrollment Request Module* – displays enrollment request status, monitors enrollment statistics and submission trends, and supports the management of student access requests.
- *Student Document Management Interface* – allows registrar to view student enrollment information, review uploaded enrollment documents, generate student assessment PDFs, and approve or reject enrollment applications during the enrollment review process.

- *User Management Module* – manages student and system user accounts, including adding, updating, viewing, deleting, filtering, and promoting records in the centralized database.
- *Sections & Subjects Module* – manages subject schedules and class assignments by grade and section, allowing administrators to add, update, view, delete, and filter records, including subject name, subject code, day, time, and semester.
- *Payment Processing Module* - manages student payables, records and applies payments, handles discounts/grants, down payments, and installment plans, calculates remaining balances, displays payment confirmation feedback, and generates assessment form PDFs.
- *Document Management Module* – manages student-submitted enrollment documents by providing search and filtering tools and access to document records for review and verification during enrollment processing.
- *Tuition Fee Manager Module* – configures and updates tuition fee components such as tuition, miscellaneous fees, aircon, HSA, and books per grade level for Grades 7–12, with computed total amounts and options to save or reset fee configurations.
- *Profile Module* – displays and allows updating of the administrator’s personal account information, including full name, username, user role, and email address, and provides an option to change the password.

The Teacher can access the following:

- *Attendance Analytics Access* – to view attendance data for the students they handle, enabling teachers to track presence, monitor attendance patterns, and address absenteeism.

- *Performance Analytics Access* – to view analytics for the students they handle, enabling teachers to identify gaps, monitor progress, and provide academic guidance or intervention.
- *Disciplinary Records and Extracurricular Activities Access* – to view and manage student behavior and activity participation, enabling teachers to monitor conduct, track involvement, and support student development.
- *Grade Encoding Management Module* – loads students by grade level and subject, encodes and saves student grades, and monitors class performance indicators such as class average, passing rate, and highest grade.
- *Attendance Tracker Module* – records and manages student attendance by grade and section, allows date-based attendance entry, supports saving daily logs, and generates attendance reports in PDF format for selected reporting periods.

The Registrar can access the following:

- *Enrollment Request Module* – displays enrollment request status, monitors enrollment statistics and submission trends, and supports the management of student access requests.
- *Student Document Management Interface* – allows registrars to view student enrollment information, review uploaded enrollment documents, generate student assessment PDFs, and approve or reject enrollment applications during the enrollment review process.
-
- *User Management Module* – manages student and system user accounts, including adding, updating, viewing, deleting, filtering, and promoting records in the centralized database.

- *Document Management Module* – manages student-submitted enrollment documents by providing search, filtering, and access to document records for review and verification during enrollment processing.
- *Profile Module* – displays and allows updating of the registrar’s personal account information, including full name, username, user role, and email address, and provides an option to change the password.

The Cashier can access the following:

- *Payment Processing Module* - manages students account balances, processes and applies payments to specific fee components, handles discounts/grants, and down payments, supports tuition billing and installment planning, and calculates remaining balances with the payment confirmation feedback.
- *Profile Module* – displays and allows updating of the cashier’s personal account information, including full name, username, user role, and email address, and provides an option to change the password.

The Student, Parent or Guardian can access the following:

- *Online Enrollment Portal* – a digital form for new, returning, and transfer students to enter enrollment details, upload required documents, and submit applications.
- *Document Upload Facility* – to submit required enrollment documents through a drag-and-drop interface with supported file format and size limits.
- *Student Performance Overview Dashboard* – displays a summary of a student’s current academic records, including quarterly grades and overall averages, within the student dashboard for academic progress monitoring
- *Grade Viewing Portal* –presents subject grades, quarterly marks, and overall averages

within the student dashboard.

- *Subjects for Today Panel* – displays the list of scheduled classes for the day, including subject names and corresponding time slots.
- *Payables Module* – to monitor current balances and view payment history, adjustments, and assessment total fees.
- *Events Module* – displays school events, activities, and important dates within a 15-day period, allowing students and parents to stay informed and track upcoming school schedules.
- *Profile Module* – displays the student’s personal and academic information, including full name, username, user role, grade level, section, and LRN, allows password changing, uploads required documents, and views submitted files such as PSA Birth Certificate, Report Card (SF9), Certificate of Good Moral Character, and 2x2 ID Picture.
- *Announcement Module* – displays school announcements and updates, allowing students and parents to stay informed about notices, advisories, and school information.

This scope ensures that the proposed system directly addresses the key challenges identified in both administrator interviews and system analysis, such as manual enrollment processing, physical document handling, inconsistent fee calculations, and limited financial transparency for parents.

Limitations

The proposed project, Advent-Link: A Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy, focuses exclusively on automating enrollment-related processes and financial assessment generation. While the system aims to significantly improve efficiency and accuracy,

several limitations apply:

- *The system will not include attendance monitoring functionality.*

Based on the school's operational structure and the specific focus of this project, the system will not incorporate student attendance tracking, class monitoring, or related biometric features. These functions remain separate under the school's existing attendance management procedures.

- *The system will not handle faculty or staff management functions.*

All modules and user roles within the system are designed specifically for the student enrollment processes. Faculty records, staff profiles, teacher assignments, and payroll management are excluded from the project's scope.

- *The system will not handle campus facility management or reservation systems.*

All functions related to classroom assignments, facility reservations, equipment management, and campus resource scheduling are beyond the project's intended scope.

- *The system will not include online payment integration.*

Payments will continue to be processed manually through the school's existing procedures, such as cash or bank transfer. The system will only record and track payment entries; it will not support automated online payment gateways or third-party payment processing.

- *The system is institution-specific and may require adaptation for other schools.*

Advent-Link is designed based on the workflow, policies, and requirements of Baesa Adventist Academy. Other institutions may need modifications in fee structure, approval process, user roles, and enrollment procedures before the system can be used effectively in their environment.

CHAPTER 2

REVIEW OF RELATED LITERATURE AND SYSTEMS

Local Literature

Web-Based Enrollment System: An Evaluation (Baliwasan Senior High School, 2022)

An evaluation study conducted at Baliwasan Senior High School (2022) examined the performance of a web-based enrollment system using software quality criteria such as functionality, reliability, usability, efficiency, maintainability, and portability. Through user surveys administered during the live enrollment period, the researchers assessed how the system performed under real operational conditions, particularly during peak student influx. Findings revealed that the system significantly improved enrollment speed, reduced user errors, and enhanced overall satisfaction among students and school personnel. However, the study also identified areas needing refinement, including interface improvements and optimization for heavy loads. This study is relevant to the present research because it underscores the importance of evaluating digital enrollment systems beyond technical implementation, highlighting the need for user-centered testing, responsiveness under peak volume, and continuous improvement strategies. For the current project, these insights are crucial, especially for the automated assessment slip generation module, which must maintain precision, reliability, and efficiency even during high-traffic enrollment periods. The study validates the necessity of real-world testing as a foundation for system success.

Enhancing Academic Efficiency: A Comprehensive Online Enrollment System for Asbury College Incorporated

Aspa et al.s (2025) designed and developed a comprehensive online enrollment system for a college in the Philippines (Asbury College Incorporated) to address inefficiencies inherent in traditional manual enrollment processes - such as long queues, repetitive manual procedures, data entry errors, and limited accessibility of student

records. Their system replaced paper-based enrollment forms with a digital enrollment platform, offering modules for student enrollment, course/subject selection, schedule management, subject management, and grade viewing. The system architecture was implemented using a three-tier design (user interface, application logic, and database), which supports modularity, easier maintenance, and scalability. As part of their evaluation, they applied the ISO-9126 software quality model to measure functionality, reliability, usability, efficiency, maintainability, and portability. Their results showed that the system effectively minimized user errors, shortened enrollment processing time, improved administrative efficiency, and was rated “Excellent” by end-users. The study concludes that the online enrollment system is a reliable, efficient, and user-friendly solution that significantly improves institutional enrollment operations.

This literature is especially pertinent to the present study because it demonstrates a well-structured, modular web-based enrollment system implemented within a Philippine college environment - thereby providing a contemporary and locally relevant blueprint for digital enrollment systems. The use of a three-tier architecture in Asbury College’s system aligns with best practices for separation of concerns and future scalability, which supports our plan to incorporate more advanced features (e.g., automated assessment slip generation, course-selection guidance, fee computations). The emphasis on system quality evaluation using ISO-9126 also underscores the importance of addressing non-functional requirements (usability, reliability, maintainability), which will guide our testing and deployment strategy for the system at Baesa Adventist Academy.

Web-Based Enrollment System for Public Junior High School in the Philippines: A Case Study in the Province of Cavite Public Schools

Mayo et al. (2022) designed and implemented a web-based enrollment system for a public junior high school in Cavite to address persistent problems in manual enrollment, including long queues, slow verification, inconsistent records, and high administrative workload during peak periods. Their system introduced online submission of enrollment data, automated checking and verification processes, and role-based access for teachers,

registrars, and administrators, resulting in faster processing time, improved accuracy, and reduced physical congestion. Stakeholders reported higher efficiency and transparency in enrollment transactions after deployment. This study is significant to the present research because it demonstrates the feasibility, effectiveness, and relevance of adopting a web-based enrollment platform within the Philippine educational environment. It also establishes a strong local foundation showing how digitized workflows can minimize errors, streamline administrative procedures, and support large-scale enrollment demands—gaps that the current study seeks to address. Furthermore, while Mayo et al. focused on general enrollment automation, the present study extends this direction by integrating an automated course selection guidance feature to assist students in making accurate and appropriate subject choices, thereby enhancing the overall functionality and decision-support capability of the system.

Intellischool: A Student Information System for senior High School (2024)

Campanan, Bermejo, and Madrigal (2024) developed Intellischool: A Student Information System for Senior High School, a web-based student information system designed to simplify and manage student-related academic records more efficiently. The study aimed to ensure data accuracy and data consistency, develop a paperless and web-based class record, promote fairness and transparency in generating forms, and improve parent-school communication through a built-in messaging system. The system was developed using the Rapid Application Development (RAD) model and implemented with CodeIgniter PHP Framework, MySQL, jQuery, and Code Espresso SMS Gateway. For its evaluation, the researchers used test cases and the Post Study System Usability Questionnaire (PSSUQ), which showed a passed functionality result and favorable usability feedback from users.

This study is relevant to the present research because it demonstrates how a centralized web-based student information system can improve the accuracy, organization, and accessibility of academic records. The implementation of paperless processing and centralized record management supports the goals of the proposed Advent-Link system, particularly in streamlining enrollment procedures and maintaining reliable student information. Furthermore, the study reinforces the importance of usability

and system efficiency, which are essential considerations in the development of a user-friendly enrollment and assessment platform for Baesa Adventist Academy.

Enrollment Appraisal Using Rule-Based Decision Support System (2024)

A study conducted by Villaruz and Diamante (2024) presented a web-based enrollment appraisal system that utilized a rule-based decision support mechanism for universities and colleges in Antique, Philippines. The researchers developed the system to improve the efficiency and reliability of enrollment evaluation procedures by automating the assessment of applicant qualifications based on predefined institutional criteria. The platform employed a two-tier architecture composed of a client-side interface and a secure server-side processing environment capable of evaluating enrollment requirements and eligibility conditions. The study followed the Rapid Application Development (RAD) methodology and evaluated the software using McCall's Software Quality Standard and ISO/IEC 25010 criteria. Results of the evaluation indicated that the system performed well in terms of functionality, usability, and security, while also identifying opportunities for interface enhancement and stronger user confidence in data protection.

This study is significant to the present research because it demonstrates how automated rule-based processing can improve enrollment-related transactions by minimizing manual evaluation and increasing consistency in decision-making. Its emphasis on secure processing, system functionality, and efficient enrollment handling aligns with the objectives of the proposed Advent-Link system. In addition, the study supports the integration of automated features within enrollment platforms, which is relevant to the present study's implementation of automated assessment slip generation and centralized enrollment processing.

Foreign Literature

Modernizing Student Enrollment Processes through Web-Based Systems: A Case Implementation at MA Al-Aqsha Massaile (2025)

Utami, Markani, Awaliyah, Asnimar, Sabitu, and Saifullah (2025) conducted a study titled *Modernizing Student Enrollment Processes through Web-Based Systems: A Case Implementation at MA Al-Aqsha Massaile*, which focused on improving the efficiency of student admission

procedures through a web-based enrollment platform. The researchers identified several issues associated with the institution's traditional manual enrollment process, including inefficient data management, long queues during registration, delayed announcement of selection results, and difficulties in organizing applicant records. To address these concerns, the researchers designed and implemented a computerized enrollment system that enabled digital registration and centralized management of applicant information. The study utilized the Waterfall Model as its software development methodology, covering requirements analysis, system design, implementation, testing, and maintenance phases. The proposed system was evaluated based on user satisfaction and operational effectiveness, with findings indicating that the platform improved accessibility, accelerated enrollment transactions, reduced administrative workload, and enhanced the overall efficiency of the admission process. The study further emphasized that the inclusion of user-friendly features contributed to wider accessibility and better usability among students and school personnel.

This literature is relevant to the present study because it demonstrates how a web-based enrollment system can modernize traditional admission procedures and improve institutional efficiency through digital processing and centralized data management. Its focus on minimizing manual procedures, improving accessibility, and enhancing operational performance aligns with the objectives of the proposed Advent-Link system for Baesa Adventist Academy. Furthermore, the study supports the importance of implementing a structured software development methodology and designing user-friendly interfaces, which are significant considerations in the development of an effective enrollment and assessment platform.

Website-Based Student Enrollment System at MTs Al Anwar PerakJombang

Munawarah and Ahmad Insani Asadullah (2024) developed a study titled "Website-Based Student Enrollment System at MTs Al Anwar Perak Jombang." The research introduced a web-based student admission information system to address inefficiencies in the traditional manual enrollment process, including time management issues, data errors,

and difficulties in monitoring enrollments. Using PHP and MySQL with the Waterfall development model, the system provides features such as online registration, data validation, student information management, and automated registration card generation accessible through a user-friendly web interface.

The study demonstrated that implementing a digital enrollment system significantly improves efficiency and accuracy in the student admission process while enhancing transparency for prospective students and parents. The system was validated through black box testing, confirming successful functionality across login, registration, form filling, data management, and document download features. However, it focuses specifically on the enrollment and registration phase without addressing post-enrollment processes such as assessment slip generation or ongoing student records management. The proposed system for Baesa Adventist Academy extends beyond initial enrollment by incorporating automated assessment slip generation, providing a more comprehensive solution that manages both the enrollment process and the continuous documentation needs throughout the student's academic journey.

Development of Student Information System using Unified Modelling Language

Abass, O.A., Ogunsanwo, G.O., and Akinrotimi, A.O. (2024) developed a study titled "Development of Student Information System using Unified Modelling Language." The research introduced an automated student information system to address drawbacks in manual student data management, including lost student information, inaccurate result calculations, delayed report releases, and insecure records. Using Unified Modelling Language (UML) for system design, Java NetBeans IDE for the front-end interface, and MySQL for database implementation, the system provides features such as student bio-data management, result entry and computation, course registration tracking, and result verification accessible through separate portals for administrators and students.

The study demonstrated that implementing a computerized student information system significantly improves data security, accuracy in result computation, and efficiency in generating academic reports while reducing bureaucratic bottlenecks associated with

traditional paper-based methods. The system was validated through integration tests confirming its adequacy, scalability, security, and usability. However, it focuses primarily on student record management and result processing without addressing the initial enrollment phase or automated document generation capabilities. The proposed system for Baesa Adventist Academy encompasses both the front-end enrollment process with automated assessment slip generation and the comprehensive management of student records, providing an integrated solution that bridges the gap between student admission and ongoing academic documentation throughout their educational journey.

Design and Build a New Student Registration Information System Supported by SMS Gateway at Alhira Middle School

Yosdarso Afero (2021) developed a study titled "Design and Build a New Student Registration Information System Supported by SMS Gateway at Alhira Middle School." The research introduced a web-based online registration information system integrated with SMS Gateway technology to address challenges in the manual student admission process, including the lack of online registration capability, data security issues due to paper-based archiving, and accessibility barriers for prospective students from outside the local area who had to physically visit the school to register and obtain information. Using the 4-D development model (Define, Design, Develop, Disseminate) combined with the Waterfall SDLC approach, the system was developed using Sublime Text, MySQL database, and Wamp server, providing features such as online registration forms, automated SMS notifications for registration confirmation and selection results, and administrative tools for managing applicant data.

The study demonstrated that implementing a web-based registration system with SMS Gateway support significantly improves accessibility for distant applicants, reduces transportation costs and time requirements, and enhances data security compared to traditional paper-based methods. The system was validated through comprehensive testing, achieving a validity score of 0.88 (very valid), practicality score of 93.33% (very practical), and effectiveness score of 0.79 (very effective). However, it focuses exclusively on the initial student registration and admission phase with SMS-based

communication, without addressing post-enrollment processes such as ongoing academic record management or automated generation of academic documents. The proposed system for Baesa Adventist Academy builds upon this foundation by not only streamlining the enrollment process but also incorporating automated assessment slip generation, providing a more complete solution that extends beyond admission to support continuous academic documentation needs throughout the student enrollment lifecycle.

A Secure Web-Based School Management System Using Role-Based Access: Case Study from Nigeria

S. Sabo, A. M. Umaru, U. L. Mohammed, and L. A. Yusuf (2025) developed a study titled "A Secure Web-Based School Management System Using Role-Based Access: Case Study from Nigeria." The research introduced a secure web-based School Management System for Imamu Hafsin Model International School in Kano to address inefficiencies in manual student registration, grade management, and ID card distribution. Using Node.js, Express.js, MySQL, and Bcrypt encryption, the system implements a three-tier architecture with hierarchical role-based access control (Super Admin, Assistant Super Admin, and Admin), automated ID card generation using PDFKit, secure password recovery, and real-time demographic analytics dashboards.

The study demonstrated significant improvements in administrative efficiency, achieving 1.8-second average login response time, less than 2% error rate, and over 90% reduction in task completion time compared to manual processes. Field testing with 50 participants showed high satisfaction rates across usability (85%), reliability (90%), and security (82%). The system outperformed existing platforms like Fedena and OpenSIS through localized curriculum support, simplified credential retrieval, and integrated academic and behavioral assessment tracking. The proposed system for Baesa Adventist Academy applies similar role-based access control and automated document generation principles but specifically targets the enrollment process with automated assessment slip generation, filling the gap between general school administration and specialized enrollment documentation automation while maintaining demonstrated security and efficiency standards.

Synthesis

The reviewed local and foreign studies collectively demonstrate the growing importance of digital transformation in school enrollment and information management systems. Local literature, including works by Baliwasan Senior High School (2022), Aspa et al. (2025), and Mayo et al. (2022), consistently shows that migrating from manual, paper-based enrollment procedures to web-based systems reduces encoding errors, long queues, and administrative delays. These studies highlight how digital forms, centralized databases, and automated verification processes streamline workflows and ensure faster, more accurate handling of student information. Research by Javelosa et al. (2018) and Franceliso et al. (2015) further illustrates the benefits of integrating enrollment features within a broader Student Information System, emphasizing that unified data management improves accuracy, accelerates record retrieval, and enhances coordination among registrar, accounting, and academic offices. These findings closely mirror the issues identified at Baesa Adventist Academy, where manual assessment computations and spreadsheet-based record-keeping frequently result in inconsistent fee calculations and delayed release of assessment slips.

Foreign studies reinforce these insights by emphasizing system security, accessibility, and structured data handling. Scholars such as Falebita (2018) and Sabo et al. (2025) highlight the value of secure, role-based access systems that protect sensitive student information while maintaining efficient digital workflows. Works by Munawarah and Asadullah (2024) and Afero (2021) show how online registration platforms improve accessibility for both local and distant applicants, reduce the need for physical visits, and provide automated notifications and downloadable documents to enhance user convenience. Additional foreign studies demonstrate the importance of structured system development approaches, such as UML-based design and modular architectures, to create scalable and reliable platforms capable of handling large datasets effectively.

Overall, the literature establishes that modern school enrollment systems are most effective when they combine centralized record management, automated financial and document processing, secure access controls, and portals that provide students and parents with transparent access to enrollment and financial information. Guided by these findings, the proposed Advent-Link system adopts a fully digital approach that streamlines enrollment submission, automates assessment slip generation, secures student information, and offers parents real-time access to financial records. The collective evidence from the reviewed studies supports the development of this system as a practical solution to Baesa Adventist Academy's current challenges, particularly the inefficiencies arising from manual data encoding, fragmented documentation, and inconsistent fee computations.

CHAPTER 3

TECHNICAL BACKGROUND

This chapter addresses the technologies used in developing the proposed Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy. It discusses the front-end and back-end development tools, programming languages, libraries, and frameworks that will support the implementation of the system. Each technology is described based on its specific role in enabling the features of the enrollment, assessment, and administrative modules.

Overview of the Current Technologies to be Used in the System

The proposed Advent-Link: a Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy is developed using a combination of modern web technologies that support the system's user interface, system logic, and database handling. These technologies were selected not only for their reliability and flexibility but also for their compatibility with the school's existing infrastructure, ensuring that the system can be deployed without the need for expensive hardware upgrades. The system utilizes client-side and server-side technologies that work together to streamline enrollment processing, document submission, assessment computation, and financial monitoring.

On the client side, the system uses HTML5 to structure the layout of all web pages, including the enrollment form, student dashboard, and administrative interface. CSS3 is utilized to style the interface and ensure a clean and consistent design throughout the system. Bootstrap 5 provides responsive components that automatically adjust to different screen sizes, making the interface user-friendly on both desktop and mobile devices. JavaScript (ES6+) is incorporated to handle interactive elements such as form validation, file-preview functions, dynamic display of fee information, and seamless page interactions without the need for reloading.

For server-side development, the system uses PHP to manage processes such as enrollment submission, document upload handling, fee computation, and assessment slip generation. The PHP-based backend framework simplifies routing, validation, file storage, and role-based access control, ensuring that both student and administrator functionalities operate securely and efficiently. A MySQL database stores all system data, including student information, enrollment applications, uploaded documents, tuition tables, book fees, miscellaneous fees, payment logs, and assessment records. Server-side templating is used to generate dynamic pages and populate them with real-time data, while server-side access control mechanisms ensure secure user access depending on whether the user is a student or an administrator.

To support the generation of official assessment slips, the system integrates a server-side PDF generator such as FPDF, which converts formatted HTML templates into printable PDF documents. These PDFs include the student's fee breakdown, book charges, miscellaneous fees, payment history, and calculated monthly dues. The system's built-in validation and storage mechanisms ensure that uploaded documents are processed securely, stored in protected directories, and associated with the correct student records.

During development, XAMPP serves as the local testing environment, allowing the team to run Apache, PHP, and MySQL before deployment to the school's hosting platform. Email notifications for enrollment updates are supported through SMTP integration, enabling the system to send automated messages to students regarding the status of their application. Git is used for version control, ensuring that updates and revisions to the system are tracked efficiently throughout the development process.

System Development Methodology

Figure 1. Agile Model

Taken from:

<https://medium.com/@nld.anuradha/the-agile-model-in-sdlc-a-flexible-approach-to-software-development-664bf60ad9dc>

The proponents will adopt the Agile Methodology for the development of the Advent-Link system. Agile is an iterative and incremental approach that emphasizes flexibility, customer collaboration, and rapid delivery of functional software components. This is ideal for Advent-Link as it allows for regular feedback from the stakeholders at BAA, ensuring the final product aligns closely with their evolving needs.

- **Planning:** In this initial phase, the project requirements, scope, and objectives defined in Chapters 1 and 2 will be broken down into a list of features to be developed, known as the "product backlog".
- **Design & Development (Sprint):** The project will be divided into fixed-length iterations called "sprints," typically lasting 1-4 weeks. Each sprint will focus on designing, coding, and implementing a small set of features from the product backlog (e.g., user registration module, facial recognition login for one kiosk).

- **Testing & Review (Sprint Review):** At the end of each sprint, a working increment of the system will be demonstrated to the project adviser and school representatives for feedback. The system will be tested for bugs and performance issues concurrently within the sprint.
- **Iteration:** Based on the feedback from the review, the product backlog will be updated and reprioritized. The team then plans the next sprint, continuing the cycle of design, development, testing, and review until the entire system is complete and refined.

This iterative cycle ensures that the system is constantly improved and validated against user expectations, reducing the risk of major deviations from requirements.

Front-End Development

- **HTML5:** Will be used to build the structural foundation of all web pages in the student and admin dashboards, providing a semantic layout for forms, tables, and interfaces used during enrollment, document submission, and assessment viewing.
- **CSS3:** Will be used to style the entire system interface, ensuring visually organized layouts for enrollment forms, document upload sections, dashboards, and assessment slip viewing pages.
- **Bootstrap 5:** Will be used to create responsive and mobile-friendly layouts, making all pages accessible regardless of device. It will simplify the design of buttons, modals, alerts, and form components for enrollment and financial information pages.
- **JavaScript (ES6+):** Will be used to enhance user interactions, such as validating enrollment forms, handling file upload previews, enabling dynamic updates on fee calculations, and improving responsiveness of dashboard elements without page reloads.
- **Tailwind CSS:** Will be utilized to implement a highly customizable and utility-first styling approach. It will allow for precise control over the design system, enabling the creation of unique, modern UI components for the user dashboards while maintaining a consistent visual identity across the entire application.

Back-End Development

- PHP: Will serve as the main server-side technology responsible for handling enrollment submissions, processing document uploads, computing tuition and fees, generating assessment slips, and managing authentication for both students and administrators.
- MySQL: Will be used as the primary database to store student profiles, enrollment records, uploaded documents, tuition tables, book fees, miscellaneous fees, payment history, and generated assessment information in an organized and relational structure.
- XAMPP (Local Development Environment): Will be used during development for local hosting, allowing testing of database interaction, file uploads, and assessment generation before deployment.

Data Flow Diagram (DFD)

Figure 2. Data Flow Diagram

Level 0 – Context Diagram

Student

- Submits enrollment form
- Uploads required documents
- Views payment history and assessment

slips Administrator

- Reviews enrollment submissions
- Updates fee tables
- Processes payments
- Generates assessment slips

Figure 2.1 Data Flow Diagram

Level 1 – Enrollment Process Flow

Student

- Creates account
- Logs in
- Completes online enrollment form
- Uploads documents
- Submits Application System
- Stores application in database
- Notifies admin for verification Administrator
- Reviews submission
- Updates as Approved/Pending/Declined
- Requirement Analysis and Documentation

Functional Requirements

- The system shall allow students to log in securely using their registered credentials.
- The system shall allow administrators to log in through an admin portal with elevated access privileges.
- The system shall allow students to fill out an online enrollment form for new and returning students.
- The system shall allow students to upload required documents such as birth certificates, Form 137, and report cards.
- The system shall store all submitted enrollment information and documents in the database.
- The system shall notify administrators when a new enrollment submission is made.

- The system shall allow administrators to review, approve, or decline enrollment applications.
- The system shall allow administrators to add and update tuition fee tables per grade level.
- The system shall allow administrators to add and update book fees and miscellaneous charges.
- The system shall automatically compute the total assessment based on tuition, books, miscellaneous fees, and initial downpayment.
- The system shall compute the remaining balance after downpayment and divide it into monthly dues.
- The system shall generate an assessment slip containing student information, fee breakdown, and payment schedule.
- The system shall allow students to download their assessment slip in PDF format.
- The system shall store generated assessment information in the database for future review.
- The system shall allow administrators to encode partial payments made by students.
- The system shall automatically update the student's remaining balance based on payment entries.
- The system shall allow students to view their current balance and payment history.

Non-Functional Requirements

Usability:

- The system shall automatically update the student's remaining balance based on payment entries.
- The system shall provide clear instructions, labels, and form prompts throughout the enrollment and financial processes.

Performance:

- The system shall respond to all user actions within an acceptable timeframe.
- The system shall handle file uploads without causing system downtime.

Security:

- The system shall secure user credentials using encrypted password handling.
- The system shall restrict access to sensitive information based on user roles.
- The system shall validate all uploaded files to prevent invalid or harmful file types.

Reliability:

- The system shall ensure accurate computations for tuition, fees, balances, and monthly dues.
- The system shall maintain consistent performance during multiple concurrent enrollments.

Compatibility

- The system shall be accessible through modern web browsers such as Chrome, Firefox, and Edge.

- The system shall be responsive and accessible on both desktop and mobile devices.

Calendar of Activities

August

- The proponents began the capstone project with a meeting with the project adviser to formulate initial ideas for the proposal.
- The proponents talked about the target client and companies and discussed possible projects to propose. The initial interview questions were also formulated during this period.
- The proponents added and revised the initial interview questions and planned the schedule for conducting the interview with the potential client.
- The proponents formulated possible titles for the proposal. The transcription of the initial interview was completed and the proponents began writing the manuscript for Chapters 1 and 2, which includes the Introduction, Project Context, Statement of the Problem and Objectives, and Scope and Limitations, and the Review of Related Literature (RRL)

September

- The proponents analyzed the panelist recommendations for the revision of the initial manuscript.
- The proponents dropped the initial company due to being uncooperative during the evidence gathering processes, which was necessary for the study.
- The proponents prepped and conducted an interview with a new company, Baesa Adventist Academy (BAA), to gather data and requirements for the new proposal.

- The proponents created a new manuscript for the capstone project based on the data gathered from the new company, Baesa Adventist Academy.
- The proponents conducted a final checking of the new manuscript and the transcript from the interview with the new company to ensure accuracy and completeness for the proposal defense.

November

- The proponents revised the manuscript based on feedback and gathered more evidence to support the study.
- The proponents conducted additional data gathering to further solidify the requirements and context for the proposed system for Baesa Adventist Academy.
- The proponents added Chapter 3 (Methodology) to the manuscript, detailing the technical approach for the system development.
- The proponents conducted a general meeting with the project adviser to plan the system development, including the finalization of programming languages and technologies to be used for the Advent-Link system.

CHAPTER 4

RESULTS AND DISCUSSION

Testing

The proposed system, Advent-Link: A Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy, was evaluated to determine whether the system performs efficiently, accurately, securely, and reliably during actual operation. The testing procedures were conducted to ensure that the developed platform satisfies the operational requirements of the institution, particularly in addressing issues involving manual enrollment processing, delayed assessment generation, inconsistent fee computations, and inefficient management of student records.

The proponents conducted several forms of testing including functionality testing, reliability testing, usability testing, efficiency testing, maintainability testing, and security testing. These tests were performed to verify whether the developed system operates according to the identified functional and non-functional requirements of the study.

Functionality

Functionality testing was conducted to verify whether each module of the system performs according to its intended purpose. The proponents tested the enrollment module, document upload feature, assessment computation process, payment monitoring system, administrative approval process, and automated PDF assessment slip generation.

The developed system contains the following modules:

- Online Enrollment Module
- Student and Parent Dashboard
- Automated Assessment Slip Generation Module
- Payment Monitoring Module
- Registrar Management Module
- Cashier Management Module
- Document Upload and Verification Module
- User Account and Role Management Module
- Announcement and Notification Module

Results showed that the system successfully handled student registration, enrollment submission, and document uploading without data loss or processing errors. The automated assessment module accurately generated tuition fee breakdowns, miscellaneous fees, balances, and monthly payment schedules based on the encoded financial data of the school.

The registrar and cashier modules also functioned properly during testing. Administrators were able to approve or reject enrollment applications, update payment records, and generate downloadable assessment slips efficiently. The PDF generation feature worked correctly and allowed students and parents to access assessment documents online.

The findings indicate that the system effectively minimizes manual encoding processes and improves the accuracy and efficiency of enrollment operations at Baesa Adventist Academy.

Reliability

A Reliability test was conducted to determine whether the system can consistently perform its intended functions without failure during repeated operations. The proponents tested repeated enrollment submissions, document uploads, and payment updates. The results showed that the system consistently stored and retrieved student records without duplication, corruption, or data inconsistency. Enrollment information remained synchronized across the administrative modules due to the centralized database structure. The automated assessment computation also produced consistent results even after repeated transactions and updates. These findings demonstrate that the system is stable and dependable for the enrollment operations of the institution.

Usability

Usability testing focused on determining how easy the system is to understand and operate for students, parents, registrars, and cashiers. The system interface was developed using HTML5, CSS3, Bootstrap 5, JavaScript, and Tailwind CSS to ensure responsive and user-friendly web pages compatible with desktop and mobile devices. During testing, users were instructed to complete enrollment tasks such as account registration, enrollment form submission, uploading of requirements, viewing balances, and downloading assessment slips. Results showed that users were able to navigate the system efficiently with moderate to minimal assistance. The organization of forms, dashboards, navigation menus, and buttons improved the overall accessibility and convenience of the platform. The responsive design also allowed users to access the system using smartphones, tablets, and desktop computers without significant interface issues. The findings indicate that the system provides a convenient and accessible enrollment platform for both school personnel and students.

Efficiency

An Efficiency test evaluated the responsiveness and processing performance of the system during simultaneous operations and database transactions. The proponents tested the system during multiple enrollment submissions, repeated assessment requests generation, and file uploads. Results showed that the pages, dashboards, and administrative modules loaded within acceptable response times. Assessment computations and PDF generation procedures were completed efficiently without causing server interruptions or system crashes. Since the system is already deployed using Hostinger web hosting services, the proponents were also able to evaluate the accessibility and responsiveness of the platform in an actual online environment. The hosted system remained accessible through internet connectivity and allowed users to access enrollment services remotely. The findings demonstrate that the developed system is capable of supporting the expected enrollment workload of Baesa Adventist Academy efficiently.

Maintainability

A Maintainability test was conducted to determine whether the system can be modified, updated, and managed easily in the future. The proponents designed the system using modular architecture to simplify maintenance and future improvements. The system structure separates the user interface, application logic, and database management processes, allowing updates to be performed without significantly affecting other modules of the system. Testing showed that modifications such as updating tuition fee tables, editing announcements, adjusting user permissions, and changing academic year settings could be implemented successfully without affecting the core enrollment functions. This flexibility allows the system to adapt to future institutional requirements and policy changes.

Security

Security testing was conducted to evaluate whether the system adequately protects sensitive student and financial records. The proponents implemented role-based access control to restrict system access depending on user type, including administrator, registrar, cashier, student, and parent accounts. Login authentication, password encryption, session handling, and file upload validation were tested to determine the system's protection against unauthorized access and invalid file submissions. Results showed that the system successfully restricted users from accessing unauthorized modules and protected sensitive records from unauthorized modification. Uploaded documents were also validated according to file type and file size limitations to reduce risks associated with malicious uploads. The findings indicate that the system provides adequate security and protection for enrollment and financial records.

Description of the Prototype

The Advent-Link system prototype is a web-based enrollment and assessment management platform developed to automate the enrollment procedures of Baesa Adventist Academy. The system integrates enrollment processing, automated assessment generation, payment monitoring, and centralized student record management into a single online platform.

The development of the prototype was based on the institution's identified problems involving manual enrollment processing, spreadsheet-based computations, delayed release of assessment slips, and inefficient record management.

System Requirements

Hardware Requirements

Client-Side Requirements

- Desktop computer, laptop, tablet, or smartphone
- Minimum of 4 GB RAM
- Stable internet connection
- Modern web browser

Server-Side Requirements

- Intel Core i3 processor or equivalent
- Minimum of 8 GB RAM
- Adequate storage for uploaded files and records
- Web hosting environment

Software Requirements

- Operating System: Windows 10 or later
- Web Browser: Google Chrome, Mozilla Firefox, Microsoft Edge
- Programming Languages: PHP, JavaScript, HTML5, CSS3
- Database Management System: MySQL
- Development Environment: XAMPP
- Frameworks and Libraries: Bootstrap 5 and Tailwind CSS
- PDF Generation Tool: FPDF
- Hosting Platform: Hostinger
- Preliminary Design

The prototype follows a three-tier web architecture composed of the presentation layer, application layer, and database layer. The presentation layer manages the user interface and user interaction. The application layer processes enrollment validation, assessment computations, payment monitoring, and administrative operations. The database layer stores student information, enrollment records, payment data, uploaded documents, and generated assessment slips. The enrollment process begins when students or parents create accounts and submit enrollment information together with the required documents. The registrar reviews and verifies the submission before approving the enrollment application. Once approved, the system automatically generates the student's assessment slip containing tuition fee breakdowns, balances, and payment schedules. Students and parents may then access the generated assessment records and monitor payment updates through their dashboards.

System Evaluation and Testing

The prototype was evaluated through repeated functionality, usability, reliability, and security testing involving students, parents, registrars, and administrative personnel. Results showed that the system significantly reduced manual encoding tasks and minimized errors in fee computation and assessment generation. The centralized database also improved organization, retrieval, and accessibility of enrollment and financial information. Furthermore, the deployment of the system through Hostinger web hosting allowed the proponents to evaluate the platform in an actual online environment, ensuring accessibility, responsiveness, and operational reliability for remote users. The proponents concluded that the developed prototype effectively supports enrollment automation and improves the efficiency of enrollment operations at Baesa Adventist Academy.

Implementation Plan and Results

IT Personnel Evaluation

Based on the gathered responses from the IT respondents, seven (7) out of ten (10) respondents stated that the system was easy to navigate once users became familiar with the interface and system workflow. The IT respondents observed that the website functioned properly and that the enrollment process, assessment generation, payment monitoring, and document upload features operated smoothly during testing. The respondents also noted that the system responded efficiently during navigation and transactions. Minimal errors were encountered during the evaluation period, and the website remained accessible across different devices and browsers. The document upload functionality and downloadable assessment slip feature were also positively evaluated because they simplified the submission and retrieval of enrollment requirements and financial documents. Furthermore, the IT respondents recognized that the modular structure of the system contributed to organized navigation and proper accessibility of the features available to students, parents, registrars, and cashiers. Some respondents initially required time to become familiar with the interface, but they eventually found the system manageable and efficient after repeated use. Overall, the IT respondents concluded that the Advent-Link system provides a functional, responsive, and reliable web-based enrollment platform suitable for the operational needs of Baesa Adventist Academy.

Non-IT Personnel Evaluation

The proponents also gathered feedback from ten (10) non-IT respondents to determine whether the system is understandable and accessible for users without technical backgrounds.

Results showed that nine (9) out of ten (10) non-IT respondents stated that the website was clear, user-friendly, and easy to use. The respondents found the enrollment procedures understandable and appreciated the convenience of completing enrollment tasks online without needing to physically visit the school. The respondents particularly highlighted the convenience provided by the online enrollment portal, document upload feature, and downloadable assessment slips. The Payables Module also helped users monitor balances and payment history more effectively. In addition, the “Subjects for Today” panel and “Events Module” allowed users to stay informed regarding academic schedules and school-related activities. The non-IT respondents also observed that the system functioned properly on their devices and that the interface remained organized and readable during use. Minimal confusion was encountered while navigating the website because of the clear labels, organized forms, and responsive design. Based on the collected responses, the proponents determined that the Advent-Link system is not only functional for technically knowledgeable users but is also accessible and understandable for ordinary users with limited technical experience.

Chapter 5

SUMMARY OF FINDINGS, CONCLUSION AND RECOMMENDATIONS

Summary

The study successfully developed and evaluated Advent-Link: A Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy. The system addressed major enrollment problems such as delayed registration, manual record handling, repeated submission of requirements, inconsistent fee computation, and slow preparation of assessment slips. The implementation of a centralized web-based platform improved the organization, accessibility, and efficiency of enrollment processes. The system successfully performed its intended functions, including online enrollment, document uploading, administrative approval, payment monitoring, and automated assessment slip generation. It also accurately computed tuition fees, balances, and payment schedules based on the school's encoded financial data. The centralized database improved the storage, retrieval, and synchronization of student and financial records. Based on the Testing results, the system was found to be usable, responsive, maintainable, and secure. Feedback from both IT and non-IT respondents confirmed that the system was understandable, accessible, and convenient to use. Students, parents, registrars, and cashiers were able to operate the platform with minimal assistance using both desktop and mobile devices. The system also remained accessible and responsive during online deployment, while its security features helped protect sensitive records. Overall, the findings showed that Advent-Link is an effective and practical solution for improving the enrollment operations of Baesa Adventist Academy by reducing manual workload, improving record management, and enhancing the accuracy and efficiency of enrollment and financial processes.

Conclusions

The study successfully developed and evaluated Advent-Link: A Web-Based Student Enrollment System with Automated Assessment Slip Generation for Baesa Adventist Academy. Based on the testing results and user evaluation, the system effectively addressed the major problems in the school's manual enrollment process, including delays in registration, difficulty in managing student records, manual submission of requirements, and slow preparation of assessment slips. It also showed that centralized online processing can improve the efficiency, accessibility, and organization of enrollment-related transactions. The system improved the enrollment process by providing a digital platform for online registration, document submission, and assessment generation. It reduced the need for manual encoding and helped organize student information in a centralized database, making record retrieval and monitoring easier for administrators. The feedback from both IT and non-IT respondents also showed that the system was usable and accessible, with a clear interface, organized navigation, and convenient functions for students, parents, registrars, and cashiers. In addition, the deployment of the system through Hostinger web hosting improved accessibility and supported remote use of the enrollment portal. Users were able to access enrollment services through internet-connected devices, making the process more convenient and less dependent on physical visits to the school. The automated assessment slip generation, payment monitoring, and document upload features also helped reduce administrative workload while improving the accuracy and transparency of enrollment and financial records.

Recommendations

Based on the results and findings of the study, the following recommendations are proposed:

- For Baesa Adventist Academy, the school may adopt and implement Advent-Link as part of its official enrollment process to improve transaction speed, reduce manual workload, minimize encoding errors, and enhance accessibility of enrollment information for students and parents.
- For administrators, registrars, and cashiers, proper orientation and user training should be conducted before the full implementation of the system to ensure effective use of the enrollment, document verification, assessment generation, and payment monitoring features.
- The school administration should regularly update tuition fee tables, miscellaneous fees, announcements, academic year settings, and user access permissions to maintain the accuracy and reliability of the system.
- The school should conduct routine system maintenance, database backup, and security monitoring to protect sensitive student and financial records and to ensure continuous accessibility and stable system performance during enrollment periods.
- The institution should maintain stable internet connectivity and proper web hosting management to ensure continuous accessibility, responsiveness, and uninterrupted operation of the online enrollment system.
- Future developers or researchers may further improve the system through the integration of enhanced notification features, advanced reporting tools, and additional functionalities that may support more efficient enrollment and student information management.

FINANCIAL AGREEMENT

I agree to comply with the DepEd Order No. 88 Series 2010 better know as 2010 Revised Manual of Regulation for Private Schools in Basic Education, Section 119 - Rules for Registration (Paragraph A) which states that "When a student register in a school, it is understood that he/she is enrolling for the entire school year." A student who transferred or withdrawn in writing within (2) two weeks after the beginning of classes will be charged with 10% of the total amount of tuition fees. However, if the student transferred or withdrawn within (1) one month after the beginning of classes, he/she will be charged with 20% of the total amount of tuition fees. And if the student transferred or withdrawn after (1) one month of classes, he/she will be charged with all the 100% school fees whether or not he/she attending his/her classes.

I also agree to pay all my financial obligations to the school before the year ends and to comply with the stipulation on the financial scheme including the full down payment and/or installment plan.

IN WITNESS THEREOF, I hereunto affix my signature this _____ day of _____ 20____ at Baesa Adventist Academy, 8 Baesa Road, Baesa, Caloocan City.

"The School that Trains for Service"

HEALTH FORM

This form is used by the Clinic in conjunction with the Updated Medical Form given on the first day of classes. Please complete neatly and accurately.

Student's Name

Last Name First Name Middle Name

Nickname: Gender:

Mobile Number Lives with:

Home Address Contact No.:

Date of Birth: DD/MM/YY Nationality:

Alternate person(s) to contact in case of emergency:

Father's Name Contact No.:

Mother's Name Contact No.:

HEALTH HISTORY

Does your child have an illness or condition (heart condition, seizures, etc...)?

☐ Yes ☐ No ☐ If Yes, explain: _____

Does your child have a suspected or diagnosed special need (ADD, autism, speech delay, etc.)?

☐ Yes ☐ No ☐ If Yes, explain: _____

Does your child have any allergies (to medication, food, pets, etc...)?

☐ Yes ☐ No ☐ If Yes, explain: _____

Does your child receive any medication or medical treatment, either regularly or occasionally?

☐ Yes ☐ No ☐ If Yes, explain: _____

Do you know if your child consumes tobacco products, alcohol, or illegal drugs?

☐ Yes ☐ No ☐ If Yes, explain: _____

If you know your child's blood type, please indicate: Blood Type (A, B, AB, O) Rh group (+ or -)

HEALTH FORM 2

Do you have a family doctor?

☐ Yes ☐ No Doctor's Name: _____

Contact Number: _____

Hospital Name and Address _____

If your doctor prescribes any recommendations or restrictions during the school year regarding your child's health, please submit the recommendation or certificate to school as soon as possible. Otherwise your child will be considered "physically fit" and able to participate in Physical Education (P.E.), Pathfinder and other required by the curriculum and in other activities that may be part of the school program.

AUTHORIZATION

I give consent for my child to receive the following:

- 1 Minor first aid by the nurse at the school clinic (medication and treatment) ☐ Yes ☐ No
2 Transportation to a hospital of the school's choosing, in severe cases or an emergency ☐ Yes ☐ No

NOTE: If you checked "NO" to number 1 or 2 please provide alternate care instructions by attaching an additional page of information. Thank you.

"I understand that every effort will be made to notify parents in the case of emergency. In the event that my child requires emergency medical care and I, or the alternate contacts, cannot be reached, I give permission to BAESA ADVENTIST ACADEMY administration to act on my behalf. I also authorize them to sign any necessary release forms required by the hospital.

I give permission for my child to receive diagnostic procedures, emergency surgeries, and blood transfusions required by the attending physician."

SPECIAL EDUCATION NEEDS

Does this learner have Educational Needs?
YES ☐ NO ☐

Classification/Type of Learner Special Educational Needs (LSEN): (Underline if applicable)
With diagnosis from Licensed Medical Specialist (Visual Impairment, Hearing Impairment, Learning Disability, Intellectual Disability, Autism Spectrum Disorder, Orthopedic/Physical Handicap, Speech Language Disorder, Cerebral Palsy, Special Health Problem / Chronic Disease (EG, Cancer, Multiple Disabilities))

With Manifestation (Difficulty in Seeing, Difficulty in Hearing, Difficulty in Applying Knowledge, Difficulty in paying attention and understanding, Difficulty in Applying Adaptive Skills, Difficulty in Displaying Inter-Personal Behavior, Difficulty in Mobility (Walking, Climbing and Grasping), Difficulty in Communicating.)

ENROLMENT PROCEDURES

STEP 1 Applicants must personally come and fill out the registration form and submit all the required documents to the registrar and admission office.

- ☐ Accomplished Application Form
- ☐ Accomplished ESC Application Form (with complete information Monthly Family Income and Signatures)
- ☐ PSA Birth Certificate (Original Copy)
- ☐ Report Card SF9 (Original Copy)
- ☐ Certificate of Good Moral Standing (Original Copy)
- ☐ Certificate of Transfer Credentials or Honorable Dismissal (Original copy)
- ☐ Diploma (for JHS Grade 7 Applicants) (Photocopy)
- ☐ Parent's Proof of Income (for Grade 7 ESC Grant Applicants)
- ☐ 4 pieces of 2x2 picture with white background.
- ☐ Certificate of Completion (for SHS Grade 11 Applicants) (Photocopy)

REGISTRAR

STEP 2 New applicants of the current school year are required to take the assessment test.

GUIDANCE COUNSELOR

STEP 3 Go to an admissions interview regarding the Student School Handbook with the Assistant for Student Services.

ASSIST. PRINCIPAL FOR STUDENT AFFAIRS

STEP 4 Go to an Health interview regarding the health condition of student with the School nurse.

SCHOOL NURSE

STEP 5 Applicants must be interviewed by the Principal before they become eligible for enrollment. Applicants must have a parent and student orientation.

SCHOOL PRINCIPAL

STEP 6 Pay the cashier the required admission fees.

SCHOOL TREASURER

TRANSCRIPT OF INTERVIEW

INTERVIEW 1

1. When was the company established and started operating?

Ang Baesa Adventist Academy was founded in 1967. Eto kasi yung dating Philippine College Union. So yun nga 1967, nag start eto ng high school.

2. How many students and staff members do you currently have?

Ang students natin ngayon is mga 306, bumaba tayo ng onti. 528 if kasama yung whole school including the Elementary. Ang staff po ngayon ay 19. The average of students per grade level more or less mga 30, 20 to 30 students.

3. What technology/software tools are currently being used by teachers and students?

Usually kasi mga computer mga basic lang tayo. Google classroom, pero wala naman kami masyado ano sa Google classroom kasi tapos na yung online. Ngayon, hindi na sila nag Google Classroom.

4. What expectations do you have regarding data privacy and security?

Meron naman kaming data privacy, di naman talaga namin shineshare kung anong meron dito. Kahit ngayon nga, kahit sa cctv we don't allow students to view cctv. Teacher, teacher lang talaga. Sa record, we don't give ano naman, anything.

5. What resources (budget, hardware, training) can the school allocate to support this upgrade?

Sa ngayon wala pa. Kasi, at least alam ng kasama ninyo. We are in the private school kaya lang di gaano kataas ang tuition namin. Compare sa ibang school na mataas talaga, kumbaga yung salary namin we're just, yung maintenance, electricity, water,

mga guard, then salary. Sa ibang school kasi sobrang mahal kaya nauupgrade talaga nila facilities nila. Sa amin even our facilities is more on donation. Kung meron kaming mga pa aircon, everything donation. Mga electricity may mga konti kaming budget but not enough. Kaya yung mga ganito. Yung aming IT dati, naumpisahan niya, eh busy palagi yun e, so naiistuck. Ngayon may IT naman kami, so may isang subject din siya, inaassist niya yung mga di kaya ituro nga mga basic nila sir. Yan at the same time, natutulong din sa mga editing ng mga yearbook, ganun. Di naman kasi din malaki ang sweldo din dito.

6. Does Baesa Adventist Academy have a website?

Meron po tayong dinevelop na website by the past IT po natin but nahinto po yung development so as of now wala pa po tayong gumaganang website.

7. What is the current process of BAA when enrolling a student?

So first, the parent or guardian would need to go to the registrar. Then fiillupan nila ang papel na ibibigay namin. They would also need to have their documents ready para ibigay sa amin. Kung hindi naman nila kompleto ang mga dokumento, pwede nila ito ibigay kahit sa mga susunod na linggo. Pagkatapos nila ifill up ang enrollment form at ibigay ang mga dokumento, iinput namin ito sa aming system para ma record na.

8. Where is student information currently stored?

So ang aming system dito is isa lang. Yung system dito is nasa baba yung spreadsheets and nanduon yung information ng bata and ineencode siya manually ng registrars natin. So pagkatapos namin ilagay ang mga impormasyon sa kompyuter, hahanapin nalang namin pangalan ng student then immanual namin yon ilalagay sa mga forms then ipprint na.

9. How often do parents request information about their child's academic progress or financial status? And what is the process?

I would say madalas. Mayroon lagi, mayroon usually na parent na nagtatanong sa registrar or sa cashier tungkol dun sa kanilang balanse or kung Kamusta naman ang grades ng anak nila. Ang proseso naman kapag ganito is balik ulit tayo dun sa registrar. Dun sila pwede magtanong tanong. Si registrar naman ay makikita niya ang mga ganitong impormasyon.

10. How do you currently track student tuition payments and balances?

As of now, like I said earlier, mayroon tayong system dito para sa balance ng mga students. Kapag nag enroll sila, iinput na rin natin yung binayad nila at kung magkano pa ang natitira. Makakalkula na rin nito kung magkano ang huhulugan nila kung ano man ang pinili nila.

11. What payment methods do you accept?

Cash and bank transfer.

12. How do you notify parents about unpaid balances or upcoming payment deadlines?

Usually sa mga ganitong cases, kapagka matagal na hindi pumunta ang magulang para magtanong o magbayad, bibigyan po namin ng sulat ang anak nila para ibigay sa kanila. Dun po nakasulat na di po pwede magexam ang anak nila kapag hindi po sila nakabayad.

13. Does BAA experience long queues during enrollment season?

Usually, hindi naman kami nakaka experience ng ganito. Pero kapag papalapit na ang pasukan, hindi namin maiwasan mangyari to since dagsaan ang mga parents para mag

enroll. Lalo na pag isa o dalawang linggo na lang bago ang pasukan.

INTERVIEW 2

1. Can you walk me through the step-by-step enrollment process you currently follow?

Okay first I would ask the parent or guardian if their child is an old, new, or transferee student. Then after, if they are an old student, I would then check the record of their child in our database. You would need to validate things first kung yung bata ba talaga is a student in our school. Then after, I would need to change the state of the student to be enrolled and assign a class to him/her.

2. What documents do you need to collect from parents during enrollment?

Report Card (Form 137), PSA-Issued Birth Certificate, Certificate of Good Moral, Learner's Reference Number (LRN), and a 2x2 Portrait of the student.

3. How do you currently record student information (paper forms, Excel, existing system)?

Currently, we record them by using our database, we use spreadsheets and we also print some of the information we have as a backup.

4. Approximately how many students enroll each school year?

Hmm, for Highschool and Senior Highschool its 306 tapos sa Elementary naman I am not sure about the exact numbers but it's around 220 ganon.

5. How long does it typically take to process one student's enrollment?

It would depend on whether they are old, new, or a transferee student. If there are no problems naman, I'd say for new and transferee students about 10-15 minutes and for the old students about 5 minutes.

6. How do you currently create assessment slips for students?

We have a template, it's like in a generic form so that I just need to write the details on the form. Which depends from student to student.

7. How do you calculate fees for different grade levels, student types or payable structure?

It would depend on their grade level and kung may scholarship ba sila or grant. My role is to explain it to the parent/s about our payment modes, like if they paid the full amount at one sitting, mas malelessen sila ng ilang percent and their child wouldn't need to validate their permit every month for the tests.

8. How do you store student enrollment records (filing cabinet, computer, both)?

Both. We store it on an excel spreadsheet and we also have it in paper form.

9. Have you experienced lost documents or records?

Yes we do experience lost documents or records. It can be caused by a human error like misplaced or naisama sa ibang forms ganon. Sometimes it happens sa online records if nakalimutan iinput lalo na kapag hectic and marami kaming ginagawa.

10. How do you issue official receipts?

We manually issue official receipts of Baesa Adventist Academy. So there is a generic receipt paper ready na for us to use and input the proper details for the parent or guardian.

INTERVIEW 3

1. How did you find the enrollment process at Baesa Adventist Academy?

Based sa aking experience, it was straightforward naman. You go to the registrar, and talk to the person na nasa counter. Then after that, they would give you the form na ffillup mo. Then after that, bibigay mo yung papel sa kanila ulit, then tatawagin ka nila ulit. When it comes sa anak ko, old student na kasi siya so tatawagin na kami agad usually. Pero depende parin kung marami nakapila. So pag tinawag pangalan niya, babalik kami sa counter para pag usapan na yung tuition. May mga options sila para sa huhulugan mo so mamimili nalang ang parent kung anong prefer nila.

2. What challenges did you face during your child's enrollment?

Sa ngayon yung pila lang talaga. Kasi isa lang lang pwede ma entertain ng registrar. So pag nasaktuhan mo din kasi antagal talaga gumalaw ng pila. Mga sampu ata kami nakapila pag na tyempuhan mo. Mga 1 hour din kami nakapila dun kaya nakikipag chikahan nalang muna ako or kakain muna kami sa labas. Ay isa rin pala kapag new student ang anak mo. Kasi kapag new student ka, kailangan mo yung mga birth certificate at yung iba diba? Medyo matagal sila pag dating doon. Kasi ang sabi sakín, ilalagay pa daw nila sa computer tapos isusulat din nila, kaya ayun.

3. How long did the entire enrollment process take from start to finish?

Sabi ko nga kanina, pag maraming tao, aabot talaga kayo nga isang oras mahigit. Pero pag wala naman tao, usually 15-30 minutes tapos na kayo.

4. Did you have to visit the school multiple times to complete the enrollment? If yes, how many times?

Nung una, oo. Kasi kulang yung documents namin nung lumipat kami dito kaya ang sabi, to follow nalang daw yung mga missing. Ilang beses? Mga naka dalawa o tatlo ata ako na balik.

5. How often do you check your child's school balance or financial obligations?

I would say often. Kasi kailangan mo din talaga malaman yun pag nagbubudget kayo. Paminsan kasi di mo rin talaga alam kung magkano nalang natitira, hindi mo yun maiiwasan. Kaya pag nakalimutan ko, babalik ulit ako sa Baesa.
